INDICES OF AGRICULTURAL PRODUCTION IN 21 AFRICAN COUNTRIES

Northern Africa - Prewar and yearly 1957-58, 1958-59, and 1959-60

Southern Africa - Yearly 1956-57, 1957-58, and 1958-59

Foreign Agricultural Service
USDA

November, 1959.

Notes on the Indices of Agricultural Production

The attached tables present indices of agricultural production for 21 countries of Africa and constitute a revision of the indices that were published by the Foreign Agricultural Service in November 1958. French Cameroun and the Republic of Guinea appear this year for the first time.

As in the previous study, these indices have been calculated on a postwar base (years 1952-53 to 1954-55). For the countries in Northern Africa production data for 1957-58 and 1958-59 have been revised to incorporate more recent refinements in crop estimates, and those for 1959-60 have been added. In a few instances revisions in the data for the base period were also made. For the countries in Southern Africa production data for 1956-57 and 1957-58 have been revised and those for 1958-59 have been added. Calculations were not made for prewar years because of the general lack of information on that part of Africa.

The split year designated as 1958-59 for Northern Hemisphere countries indicates crops harvested during the late spring, summer, and fall of 1958, but may include some crops, e.g. citrus, with harvests continuing into the early months of 1959.

Data for livestock products are generally for the **calendar year...1958 in this instance.** For Southern Hemisphere countries the split year 1958-59 indicates crops harvested in the later half of 1958 and the first half of 1959.

Postwar price weights were used in computing the indices. Available data on prices in these countries, including FAO price weights, were used in establishing weights. The prices used represent the average postwar value of a metric ton of each agricultural commodity in the various countries at comparable stages in the marketing channels. The individual commodity price is expressed as a percent of the value of a metric ton of wheat. Thus, a metric ton of barley, with a price weight of 65, is equal in value to .65 of a ton of wheat.

To calculate agricultural production indices for each country, the production of each commodity was multiplied by the price weight and the resulting aggregates were summed. The total aggregate for a given year was then divided by the aggregate for the base period to obtain the index. The per capita indices were obtained by dividing the indices of total agricultural production by the population indices.

The same procedure was followed in calculating the food production index, but only food crops were used. The commodities that were considered as food are given on page 46. The total output of each edible commodity was included regardless of whether or not it was all actually consumed as food. Similarly, no cognizance was taken of foreign trade, seed reserves, waste, or stock carryover. For these reasons, the indices of total and per capita food production are not to be regarded as indices of consumption.

It should be recognized that these indices represent not only basic changes in agricultural technology and economic development, but also, in some instances, special climatic conditions and changes in the political and economic situation.

1/ The present Kingdom of Morocco, which includes former French Morocco (Southern Zone), former Spanish Morocco (Northern Zone), and the former Tangier Zone. Production data for former Spanish Morocco is, in part, estimated. Agricultural production in former Tangier is negligible. 2/ Revised estimate. 3/ About 40 percent goat milk and 35 percent cow milk, the remainder is principally sheep milk. 4/ Fairly equally divided between beef and veal and mutton and lamb, with a remainder of about 5 percent representing other varieties.

Table 8 . Somalia: Indices of agricultural production, volume of production and aggregates.

1/ Almost entirely cow's milk. 2/ Mainly beef. 3/ Includes karakul pelts.

The following agricultural products were classified as food in the calculation of these indices.

Wheat	Cocoa
Corn	
Barley	Sugar, refined
Oats	
Rice, milled	Kola nuts
Sorghum and millet	Cashew nuts
Other grains	Almonds
	Bananas
Beans and peas	Plantains
Pulses	Citrus fruit
Cassava	Deciduous fruits
Yams	Grapes
Sweet potatoes	Dates
White potatoes	Figs
Cocoayams	Pineapples
Taro	Apricots
	Artichokes
Peanuts, unshelled	Carrots
Cottonseed	Onions
Sesame seed	Peppers
Nigerseed	Tomatoes
Papeseed	
Palm oil	Milk
Olive oil	
Palm kernels	Eggs
Soybeans	Meat
Shea nuts	
Bambara groundnuts
